Education

The University of Texas at El Paso

Expected Graduation Date: May 2027

B.S in Computer Science, Concentration in Software Engineering | Minor in Mathematics

Relevant Courses: Data Structures & Algorithms, Digital Systems Design, Automata/Computability/Formal Languages

Technical Skills

Languages: Java (2y), Python (6m), HTML/CSS (3y), JavaScript (2m), TypeScript (2m), Swift (3m), LaTeX (4m)

Technologies: AI/ML, Git, Astro, Django, VS Code API, Bash, Linux, QEMU

Experience

Tech Frontier

April - May 2025

AI Developer Pathway Alumni

- Acquired a strong understanding of fundamental Artificial Intelligence concepts such as **neural networks**, **machine learning**, and **natural language processing**.
- Leveraged several capabilities of Artificial Intelligence in Python, including **TensorFlow**, **Pytorch**, and **Pomegranate**.
- Independently developed an iOS application that will demonstrate the **real world utility** of these concepts to provide tangible user benefits.

STTE AI Hackathon

April 2025

- Developed an AI-powered product for the education category in collaboration with a team of four. (SchoolFlow)
- Applied skills in data analysis, frontend development, AI tools, and implemented an **SQL database backend**.

Projects

Summit - AI Outdoors Companion

May 2025

- Independently developed a proof-of-concept iOS app that leverages **on-device AI models** to provide the user with real-time guidance during outdoor activities.
- Utilizes **MLC-LLM** in tandem with the **iOS Speech framework** for real-time speech recognition for user assistance.
- Integrates **CoreML** and the **Vision framework** to provide contextually-aware assistance using the camera feed.

SchoolFlow

April 2025

- Designed an AI-powered platform for school districts to gain actionable insights by correlating real financial data with academic success metrics, visualized through graphs and dashboards.
- Implemented the website frontend and developed an AI model trained on the district's dataset.
- Trained an AI model on the school district's dataset, which was used in conjunction with a team-built **SQL database** to produce the platform's analytical outputs.

Bayesian Network Model

April 2025

- Used a **Pomegranate** and **Pytorch** to create a model that calculates the exact probabilities of different real life events based on user input.
- Modified the **knowledge base** of the model to simulate different scenarios that the average person would go through.

Nim Game Using Machine Learning

August 2025

- Worked on a game in Python that utilized **machine learning**.
- Utilized a **Q-learning algorithm** for the AI opponent which learned based on a specified amount of games, as well as games it has played with the user.
- Generates a visual output of the game's results using the **PIL** library.

HAWK RTL Design for Pedestrian Crosswalk (Digital Systems Design)

November 2024

- Recreated a **High-intensity Activated Crosswalk** design in **Xilinx Vivado** from UTEP's specifications.
- Implemented this design using **Verilog HDL** as an **Algorithmic State Machine**.
